

Mission Statement

Our Green Values

At Opticore, the main purpose of our business is to provide industry-leading engineering and consultancy services in the IT network space. As such we recognise that the IT industry is a major contributor to the climate crisis, we all now face.

Whilst we are fully aware that as a relatively small organisation, we cannot ourselves have a major positive impact on Co2 emissions, we can influence other larger organisations to consider the environmental impact of the activities they undertake. We are also aware that it is important to remember that any contribution we as individuals or organisations make, great or small, has a positive impact and so small behavioural changes when added up can provide us all with the hope that the forthcoming climate crisis will at least be manageable.

With this in mind, Opticore are committed to addressing our environmental impact in the following ways:

- All our operations and business practices will be grounded in sustainability principles, and we will seek to eliminate waste and pollution wherever possible
- Where possible we will use clean energy for all our facility's power and our entire value chain to minimize Co2 emissions
- We will continue to provide insight and education on sustainability activities to all our employees and encourage them to take positive, sustainable actions in everything they do
- We will encourage our engineers to consider Co2 emissions when designing new network solutions for our clients
- We will investigate and advise our clients on ways they can reduce their carbon footprint, leveraging industry trends and standards where possible
- We will work collaboratively with our suppliers and clients to pass on knowledge of effective activities that will positively impact Co2 emissions
